## Chapter 1: Ocean and coastline formation

### Page 15 Suggested answers

Q1. Echo sounders work by transmitting sound waves with frequencies between 10 kHz and 100kHz. These sound waves are reflected off the sea floor back to the transducer. The time taken for the sound wave to return is measured and used to calculate the depth.

Q2. Students' own diagram. See Fig 11.1 Ocean floor topography  
The continental shelf is usually flat because it is built up with sediment run off from the continent.

Q3.

	Asthenosphere	Lithosphere
Location	Beneath lithosphere	Upper layers of mantle
Composition	Plastic	Cool, relatively rigid rock
Density	3.5g/cm <sup>3</sup>	2.8-3.3 g/cm <sup>3</sup>

Q4. 50% of the earth's surface is deep ocean basin floor, which is made up of abyssal plains and abyssal hills.

Q5. The continental slope can be as great as 45°, but has an average slope of 25°. The continental rise is much less: a gradient of about 1:300.

Q6. Submarine canyons are large valleys that cut into the continental shelf. Murray Canyon is near Kangaroo Island off the South Australian coast.

Ancient rivers may have formed these canyons.

Q7. The bathyscaphe Trieste was able to descend to over 10 000 metres deep by taking on seawater as ballast (making its density higher). The Trieste could then sink. To ascend the Trieste releases its ballast.

Q8. See Fig 14.1: The composition of the earth.

Q9. Sial is a light coloured, low density granitic rock made of silica and alumina (density 2.8 g/cm<sup>3</sup>). Sima is a darker coloured, higher density basaltic rock made of silica and magnesia (density @ 3.0g/cm<sup>3</sup>).  
Sial floats on sima because it is less dense.

Q.10 The 1982 Law of the Sea states that Australia has sovereign rights to resources out as far as the seaward edge of the continental rise (see Fig 13.1).

Where tectonic plates rift apart, it is difficult to accurately define our borders with Indonesia and New Zealand.
